ABSTRACT

Background and purpose: Neuropathic Pain (NP) is a complex and chronic pain which is accompanied by nerve injury. Umbelliprenin (UMB) is a naturally occurring prenylated coumarin with anticancer, antioxidant, anti-inflammatory, antibacterial and antileishmanial activities. This study aimed to investigate the antinociceptive effects of UMB on acute, chronic and neuropathic pain and its combination therapy with morphine on the neuropathic pain.

Methods: Albino mice weighing 20-25 g were randomly divided into 13 groups (n=7), subjected to hot plate with groups including morphine 1 mg+UMB (0.01 μM/kg), morphine (1 mg/kg, i.p.), UMB (0.01 mM/kg), Imipramine 40 mg/kg and NS (normal saline) (0.9%) as vehicle), formalin test with groups including (NS, Imipramine (40 mg/kg, i.p.), morphine (9 mg/kg, i.p.) and UMB (0.01 μM/kg)) and morphine tests with groups including (NS (0.9%), imipramine (40 mg/kg, i.p.), morphine (1 mg/kg, i.p.) + UMB (0.01 mM/kg) and morphine (1 mg/kg, i.p.). The acute and neuropathic pain were evaluated using hot-plate and formalin and morphine tests. Results: Administration of UMB single dose (0.01 mM) reduced NP significantly (p<0.05) compared to the negative control and didn’t change acute pain against Diclofenac. Antinociceptive effects of UMB were comparable to Imipramine as a standard positive control. UMB potentiated morphine 1 mg/kg response on NP. Conclusion: This research indicates that UMB alone reduces NP and its combination with morphine potentiates morphine effects. Therefore, UMB-morphine co-administration is proposed to be used instead of conventional treatment.

Key words: Umbelliprenin, Neuropathic Pain, Morphine, Sciatic Nerve Ligation.

INTRODUCTION

Neuropathic Pain (NP) is caused by cancer, diabetes mellitus, Parkinson’s disease, Alzheimer’s disease. About more than 3-4.5% of global population is suffering from NP. Classical analgesics such as anticonvulsants, tricyclic antidepressants, local anesthetics, opioids analgesics have inconsistent benefit or adverse effects. About 10-30 % of patients suffering from syndromes of NP are drug resistant. There is remarkable need for novel analgesic being more effective or safer.

UMB, a prenylated coumarin, is related to naturally occurring compounds, which are widely distributed in Ferula plant species such as Citrus limon.2-4 It has been also found in celery, Angelica archangelica, Coriandrum sativum. They are belonged to a very large class of sesquiterpene which possess anticarcinogenic, free radical scavenging, anti-inflammatory, antileishmanial properties and were shown to be able to inhibit red pigment production in Serratia marcescens, decrease matrix metalloprotease (MMP) activity, and inhibit lipoxygenase and acetyl cholinesterase.

Anti-inflammatory and antinociceptive effects of UMB analogues have been studied.5,6 UMB inhibits iNOS mRNA and COX-2 mRNA expression which seem to be related to its anti-inflammatory effects.

in human lymphocytes and reduces transcription of related proteins.\textsuperscript{6,7-10} Furthermore, coumarins have anti-nociceptive effect via opioidic pathway.\textsuperscript{2,11} The roots of \textit{Ferula persica} possessing UMB, are used for the treatment of diabetes in folk medicine.\textsuperscript{12} UMB has strong lipoxygenase inhibitory properties and also has shown anti-inflammatory effect in the carrageen an hind paw edema model in mice.\textsuperscript{5}

In this study, we attempted to determine the acute and chronic antinociceptive effect of UMB alone, and in combination with morphine to investigate whether it can potentiate morphine anti-neuropathic pain.

**METHODS**

**Animals and surgery**

Male Albino mice produced from Faculty of Pharmacy of Zabol University of Medical Sciences weighing 20-25 g were randomly divided into 13 groups (n=7), subjected to hot plate test including morphine 1 mg + UMB (0.01 μM/kg), morphine (1 mg/kg, i.p.), UMB (0.01 mM/kg), Imipramin 40 mg/kg and NS (normal saline) (0.9%) as vehicle, formalin test including NS, Imipramine (40 mg/kg, i.p.), morphine (9 mg/kg, i.p.) and UMB (0.01 μM/kg) and morphine tests with 4 groups including NS (0.9%), imipramine (40 mg/kg, i.p.), morphine (1 mg/kg, i.p.)+UMB (0.01 mM/kg) and morphine (1 mg/kg, i.p). The animals were kept under constant temperature (22-25°C), 12 hour light/dark cycle and had free access to food and water. All procedures were in accordance with the guidelines from the declaration of Helsinki principles in the study of experimental animals.

**Surgery**

The animals were anesthetized by ketamine (40 mg/kg, i.p.) (Merck; Germany) and xylazine (10 mg/kg, i.p.) (Merck; Germany). Sciatic nerve was ligated in the hind limb using a piece of copper wire.\textsuperscript{13}

**Chemicals**

UMB was synthesized via the reaction of 7-hydroxy-coumarin (1mol/l) and trans-trans-farnesyl bromide (1.5mol/l) in acetone at room temperature.\textsuperscript{11} The reaction was accomplished in the presence of DBU (1, 8-diazabicyclo [5.4.0] undec-7-ene) (2M). 24 h later, the mixture was concentrated under reduced pressure and was purified by column chromatography (petroleum ether/ethyl acetate 9: 1 v/v) as white crystals.\textsuperscript{11}

**Analgesic measurement**

**Hot-plate test**

The Hot-plate test was performed to determine the effect of UMB on NP,\textsuperscript{12} with minor modifications. The animals were placed on a circular surface (diameter 19 cm) maintained at 55 ± 0.2°C and surrounded by a Plexiglas wall (12 cm high). The apparatus (Harvard; England) was equipped with a timer and a thermo coupler to maintain a constant temperature. Licking the forepaws, lifting hind paws or jumping from the surface was considered as the end point of response latencies.\textsuperscript{18} 45 seconds were indicated as cut-off time. 2 weeks after nerve ligation, pain intensity was measured.

**Formalin test**

The formalin test was performed to determine acute and chronic pain of UMB single dose (0.01 mM/kg, i.p.). The mice were considered to evaluate neuropathic pain at different times after formalin injection (0, 30, 60, 90 and 120 min). All mice received an intraplantar injection of formalin (1% in saline) in the left hind paw. The duration of paw flinches, licking, and biting, 0-5 min after injection of formalin (first phase) and between 20 and 40 min (second phase) was recorded.\textsuperscript{14}

**Morphine (1 mg/kg) UMB (0.01 mM/kg)**

This test was performed to elucidate whether UMB is able to change morphine (1 mg/kg, i.p.) effect on NP or not. The mice were randomly assigned in groups of NS (0.9%), imipramine (40 mg/kg, i.p.), morphine (1 mg/kg, i.p.) + UMB (0.01 mM/kg) and morphine (1 mg/kg, i.p.) to evaluate neuropathic pain at different times after formalin injection (0, 30, 60, 90 and 120 min).

**Statistical analysis**

Data was analyzed using Graph Pad Prism 5.00. One-way ANOVA followed by Newman-Keuls test to situations the potential differences was done. We used unpaired T test for comparison between control animals and the sciatic nerve ligated group. Statistically significant differences considered as p<0.05. Data is represented as mean ± SEM.

**RESULTS**

**Effects of UMB single dose on neuropathic pain 14 days after sciatic nerve ligation using hot plate test at 0, 30, 60, 90 and 120 min.**

There were significant differences between UMB (0.01 mM/kg) + morphine (1 mg/kg), Imipramine (40 mg/kg), UMB (0.01 mM/kg) and morphine (1 mg/kg), at 0 min (Figure 1: A), 30 min later, there were significant differences between all groups and the control group and also there was significant difference between morphine 1 mg/kg and UMB + morphine 1 mg/kg (p<0.05) (Figure 1: B). After 60, 90 and 120 min, there were significant

differences between Imipramine, UMB, and morphine 1 mg/kg + UMB (0.01 mM/kg) and morphine 1 mg/kg and NS groups (p<0.001) (Figure 1: C, D and E).

Effects of single dose of UMB on licking and latency response on the acute phase of the formalin test.

There were significant differences between UMB (p<0.05), morphine (p<0.001) and Diclofenac (p<0.01) and the control group (Figure 2: A & B).
Effects of UMB single dose on licking and latency response in the chronic phase in the formalin test.

There were significant differences between UMB, morphine and Diclofenac and the control group (p<0.001) (Figure 2: C & D).

DISCUSSION

The results indicated that UMB reduced chronic and acute pain. Moreover, NP due to sciatic nerve ligation in mice model was alleviated by UMB (0.01 mM/kg i.p.) UMB (0.01 mM/kg i.p.) in combination with morphine (1 mg/kg) could potentiate its antinociceptive effect. This was the first study on the effect of UMB on the antihyperalgesia, antinociceptive, anti-neuropathic pain and its combination with morphine.

Several studies showed that coumarin has antinociceptive and antihyperalgesia effects\textsuperscript{5,6,15,16} UMB is chemically belonged to 7-hydroxycoumarins (7-HC) which have in vivo anti-inflammatory analgesic and antipyretic effects, seems to be related to their ability in COX-2 inhibition.\textsuperscript{16} UMB has surprising inhibitory activity on soybean lipooxygenase enzyme, the key enzyme in inflammatory process, with IC\textsubscript{50} value of 0.0725 μM, compared to caffeic acid, with IC\textsubscript{50} value of 600 μM.\textsuperscript{5} It has been shown that 0.01 mM i.p. administration of UMB can significantly ameliorate inflammation, which is comparable to Indomethacin.\textsuperscript{5}

Following the formalin injection, hyperalgesia is divided into acute (the first 3-5 min) and chronic phase (15-20 min after formalin injection). UMB subsided both acute and chronic pain significantly. Nitric Oxide (NO) is one of the most detrimental especially chronic pain. Formalin rises nitrite and nitrate levels in plasma via activation of iNOS. In addition, NO can activate lipoxigenase and cyclooxygenase enzymes activity and consequently increases inflammatory and pain transduction via releasing substance \(\beta\), PG and leukotrieneis. Induction of pain in formalin test is facilitated by i.p. injection of the substances that increase NO level. Furthermore,
administration of iNOS inhibitors (p.o.,i.p. or intrathecal) can alleviate nociception especially in the second phase of formalin test and it is consistent with our study. Lipoxigenase metabolites increase sensitivity to pain in the second phase of formalin test by increasing production of hydroperoxyicosatetraenoic acid (HPETE) from arachidonic acid by 5, 12, and 15 lipoxygenase. HPETE, immediately after production, are converted to leukotrienes which the process can be inhibited by UMB.\(^7\) Using up to 20 \(\mu g/ml\) of UMB, decreased the production of NO and expression of inducible nitric oxide synthase (iNOS).\(^6\)

NP is a relatively common pain that is associated with nervous system lesions or dysfunction.\(^18\) The results showed that UMB could alleviate NP following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation. It was shown that iNOS and NO are increased following sciatic nerve ligation.

UMB (0.01 mM) with morphine (1 mg/kg) potentiated morphine antinociceptive effects. UMB shows its antinociceptive effects partly via \(\mu\) receptors stimulation. It was elucidated that coumarins pose their effects via stimulation of opioid receptors.\(^{15,22}\) Coumarins have inhibitory effects on NO and \(\beta\)-Ep levels in brain. It could be concluded that its potentiating effect on morphine is via direct activation of \(\mu\) receptors.\(^{15,22}\)

Matrix Metalloproteinase Proteins (MMPs) are critical enzymes in tumor, neovascularization and inflammation. Another hypothetical mechanism of UMB is reduction of pro-inflammatory proteins and decreasing of MMPs.\(^3\) Each component with MMP inhibitory effect such as Diclofenac sodium poses anticancer due to anti-inflammatory effect.\(^3\) Many other substances that can decrease MMPs in cells also ameliorate inflammations that are in accordance with our findings.\(^{19-23}\)

**CONCLUSION**

Taken together, UMB has strong antihyperalgesia, anti-inflammatory effect especially in the late phase of formalin test. Moreover, it can potentiate morphine (1 mg/kg) antinoiceptive effects in combination with a single dose of UMB (0.01 mM i.p.).
