ABSTRACT

Introduction: Diabetes mellitus, a metabolic disorder characterized by increased blood sugar level. Metformin hydrochloride is used to treat type I Diabetes mellitus. Metformin hydrochloride chemically 1, 1-dimethylbiguanide hydrochloride, is white crystalline powder, hygroscopic and freely soluble in water, Officially UV spectrophotometric method used for estimation of Metformin Hydrochloride from the bulk and tablets formulations. Objective: Develop and validate a simple, rapid, accurate, economic and precise UV/VIS method for Metformin Hydrochloride in bulk and tablets formulation. Methodology: Choices of a common solvent were essential so various solvent ranges including methanol, ethanol, acetonitrile and phosphate buffer and various concentrations ranges of various buffers were analyzed. Conclusion: Among different solvents water has showed better results, hence water was selected as a solvent for the proposed method. Metformin Hydrochloride showed maximum absorbance at 234 nm. The percentage recoveries for Metformin Hydrochloride were found in the range of 99-101 %. Method was quantitatively evaluated in terms of linearity, accuracy, precision, ruggedness, robustness and recovery. The method was simple, convenient and suitable for the determination of Metformin Hydrochloride from bulk and tablet dosage forms.

Key Words: Metformin HCl, UV-Spectrophotometry, Tablet.

INTRODUCTION

Chemically Metformin Hydrochloride (HCl) is a (N,N-dimethyl imidodicarbonimidic diamide monohydrate as shown in Figure 1. Metformin HCl is used in the treatment of diabetic's mellitus–II, which works to decrease the glucose absorption in the small intestine, increase of glucose transport into cells, decrease the plasma free fatty acid concentrations and inhibition of gluconeogenesis. Activation of AMPK plays a vital role in these processes. Moreover reported methods were not much cost-effective in terms of solvent consumption. The present investigation was carried out in the view of establishing a simple, rapid, accurate, economic, precise and robust UV method for estimation Metformin HCl in bulk and tablet dosage form using water as the solvent.

MATERIALS AND METHODS

Instrument

A Shimadzu UV-1800 240V UV/VIS spectrophotometer was used having two matched 1 cm matches quartz cell.
**Chemical and reagents**

All the reagents and solvents were of analytical grade. High purity deionized water was obtained from Millipore, Milli-Q (Bedford, MA, USA) purification system. Metformin HCl was purchased from Pawar supplier, Karad, Maharashtra, India. All other chemicals used were of analytical grade.

**Preparation of Standard Stock Solutions**

100 mg of Metformin HCl was weighed separately and transferred in 100 mL volumetric flasks. The drugs were dissolved in 50 mL of distilled water by sonication and then the volume was made up to the mark with the same solvent to obtain final concentration 1000 µg mL⁻¹ of the component.

**Sample Solution**

Powder of twenty tablets (Marketed tablets of metformin; Bigomet), containing 500 mg Metformin HCl, was weighed. A quantity of powder equivalent to 10 mg of Metformin HCl was taken in different 10 mL volumetric flasks containing about 5 mL distilled water for analysis and sonicated for 15 min. After sonication, the volume was made up to the mark with the same solution to obtain sample stock solution of Metformin HCl (1000 mg mL⁻¹). Further, 0.010 mL solution was quantitatively transferred to a 10 mL volumetric flask to get final concentration 10 mg mL⁻¹ Metformin HCl. The resulting solution was used for absorbance and results were recorded.

**Preparation of Working Standard Solution**

Suitable aliquots of 1000 mg mL⁻¹ solution were diluted up to the mark with water to get the concentration range of 10, 20, 30, 40 and 50 mg mL⁻¹ for Metformin HCl. The absorbance was measured at 234 nm.

**Selection of wavelength**

The wavelength for the analysis of Metformin HCl (20 ppm) was selected from the UV spectrum. The standard solution of Metformin HCl was scanned in the range of 200-400 nm and the λ<sub>max</sub> was found to be 234 nm against water shown in Figure 2.

**Amount of Metformin in each tablet was calculated by using following formula**

\[
\frac{\text{Sample Absorbance}}{\text{Standard Absorbance}} \times \frac{\text{Standard Dilution}}{\text{Sample Dilution}} \times \text{Average Weight} = \text{Amount Present (µg)}
\]

\[
\% \text{ Content} = \frac{\text{Amount Present}}{\text{Label Claim}} \times 100
\]

**Method validation**

The method was developed and validated according to the analytical procedure as per the ICH guidelines for validation of analytical procedures in order to determine linearity, accuracy precision, ruggedness, and robustness for the analyte.<sup>19,20,21</sup>

**Linearity**

The linearity was evaluated by analyzing the different concentration of the standard solution of Metformin HCl. The Beer-Lambert's concentration range was found to be 10-50 µg mL⁻¹ for Metformin HCl respectively. The linearity of the relationship between absorbance's and concentration was determined by plotting the calibration curves for Metformin HCl are shown in Figure 3 and Table 1.

**Accuracy (% Recovery)**

The accuracy study was performed using the standard addition method.<sup>22</sup> The pre-quantified 2 µg mL⁻¹ sample solution of Metformin HCl were spiked with an extra 80, 120, and 100 % of the standard Metformin HCl. Absorbances were measured at 234 nm and the concentration of drug was determined. These mixtures were analyzed by the developed method. The experiment was performed in six times. The percentage recovery of the samples, % RSD and the percentage were calculated at each concentration level shown in Table 2.

**Precision**

Repeatability measurement was carried out by analyzing six different solutions containing same concentration 20 ppm Metformin HCl and % RSD was calculated. Repeatability of the method was established by analyzing various replicates samples of metformin HCl. Precision was carried out by performing interday and intraday variation. In Inter day variation the sample was analyzed on three consecutive days. In an intraday variation in the absorbance was measured three times in a day. Inter and intraday precision was determined using 20 ppm concentration.

**Intraday Precision**

In the intraday variation study was determined for a solution (20 ppm) and was analyzed three times for the consecutive days (i.e. morning, afternoon, evening). Mean, standard deviation and % RSD was calculated and shown in Table 3.

**Interday Precision**

The interday precision was determined for a solution (20 ppm) and was analyzed for the three times on a different day. % RSD was calculated shown in Table 4.
Ruggedness

The ruggedness of the method was determined by carrying out the analysis by the different analyst in different laboratories using different UV spectrophotometer and the respective absorbance of 20 mg mL⁻¹ was noted. % RSD was calculated. The Ruggedness data and analytical performance parameters of Metformin HCl were shown in Table 5.

Robustness

The robustness was carried out to evaluate the influence of a small but deliberate variation in the spectrometric condition for determination of Metformin HCl bulk and tablet dosage form. The Robustness data for variations in wavelength of detections (±5nm) and the absorbance and its analytical performance parameters of Metformin HCl were shown in Table 6.

RESULT AND DISCUSSION

To optimize the UV parameters, several conditions were tried to achieve a good absorption and peak shape for Metformin HCl. Several solvents of different compositions were tried to provide sufficient selectivity towards the drugs. Distilled water components resulted in better sensitivity.

The methods discussed in the present work provide a convenient and accurate way for the analysis of Metformin HCl from bulk and tablet dosage form by UV Spectrophotometry method. The 234 nm wavelength was selected for analysis of Metformin HCl (Figure 2). The absorbance of Metformin HCl was found to be 1.102 to 5.710 (Table 1). Selected methods linearity was observed in the concentration range of 10-50 mg mL⁻¹. In this method, the concentration of the drug was determined at 234 nm using the respective absorptivity value shown in Figure 3.

A Linear correlation was obtained between absorbance Vs concentration. Calibration curve for Metformin HCl showed linearity in the concentration range 10-50 mg mL⁻¹. The linearity of the calibration curve was validated by the value of correlation coefficients (r²). The value of correlation coefficient for Metformin HCl was found to be 0.9998 shown in Table 1 and Figure 3. The standard addition method was employed for accuracy measurement. The percentage recoveries for Metformin HCl were found in the range of 99-101 %. The values of the recovery (%) and %RSD were shown in Table 2, which indicates the accuracy of the proposed method.

The precision of the method was determined by analyzing the drug formulation by replicate injections and precision of the system was determined by mixed standard solutions. % RSD of the analyte was found to be within the limit of 2%, shown in Table 3 and Table 4 thus the developed method was found to be in the high degree of precision. The low values of the % RSD indicate the repeatability of the proposed method. Ruggedness was determined by performing the assay with the same condition on different days, by different analysts, different instrument and different time. The test results were found within limit 99–101% shown in Table 5.
Robustness was determined by carrying out the assay during change wavelength. The % RSD was found to be not more than 2 % which was within the limit shown in Table 6.

CONCLUSION

The proposed method quantitatively evaluated in terms of linearity, accuracy, precision, ruggedness, robustness and recovery. All these factors lead to the conclusion that the proposed UV-Spectrophotometric method is simple, accurate, precise, sensitive and cost-effective. This method was adopted for the use of economical and easily available mobile phase and for the UV detector. Thus the used mobile phase makes it an excellent method for the estimation of Metformin HCl in bulk drug and its formulations.

**SUMMARY**

- UV/VIS method has been developed and validated for Metformin Hydrochloride. The Linearity was observed in the concentration range of 10-50 mg mL-1 for Metformin Hydrochloride. The correlation coefficients were found to be 0.9998. The percentage recoveries for Metformin Hydrochloride were found in the range of 99-101 %. Method was quantitatively evaluated in terms of linearity, accuracy, precision, ruggedness, robustness and recovery. The method was simple, convenient and suitable for the determination of Metformin Hydrochloride from bulk and tablet dosage forms.
